Experiment no-03 Experiment name-Implement java programs based on while ,do while and for loop.

Three types of Conditional statements this second type is loop statement .

- **while loop:** A while loop is a control flow statement that allows code to be executed repeatedly based on a given Boolean condition. The while loop can be thought of as a repeating if statement.

Syntax :

```
while (boolean condition)
{    loop
statements...
}
```

- **for loop:** for loop provides a concise way of writing the loop structure. Unlike a while loop, a for statement consumes the initialization, condition and increment/decrement in one line thereby providing a shorter, easy to debug structure of looping.

Syntax:

```
for (initialization condition; testing condition;increment/decrement)
{
   statement(s) }
```

- **do while:** do while loop is similar to while loop with only difference that it checks for condition after executing the statements, and therefore is an example of **Exit Control Loop. Syntax:**

```
do {
statements..
}
while (condition);
```

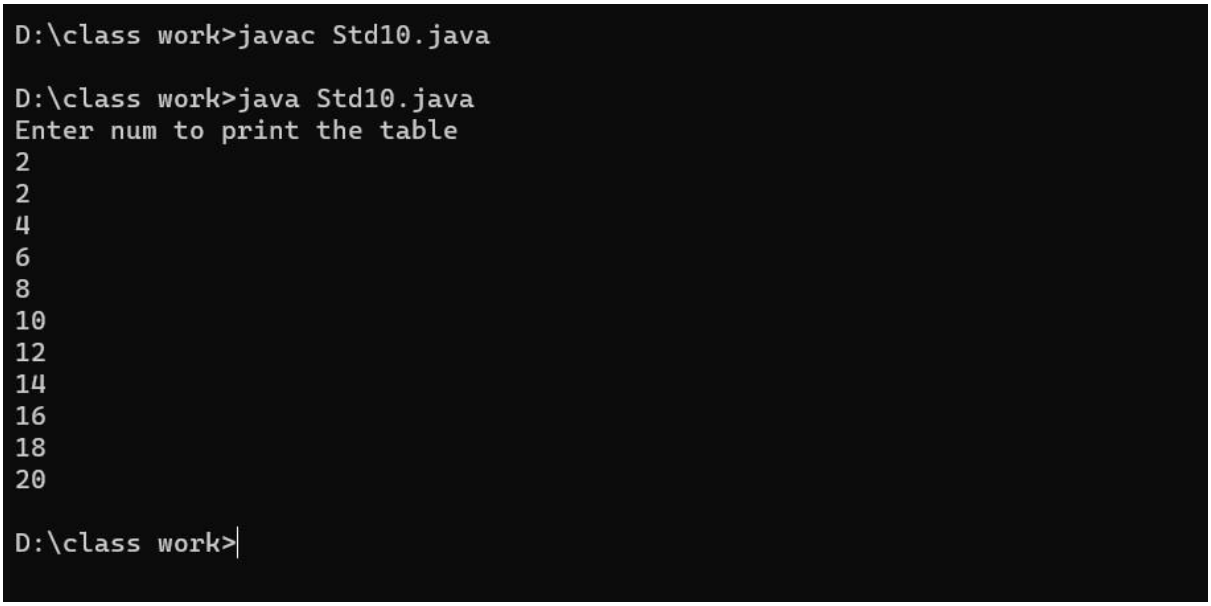
1. Implement a Java program to print multiplication table of user entered number.

Input-

```
import java.util.Scanner; class
Std10
{  public static void main(String
args[])
 {    int
num;
   System.out.println("Enter num to print the table");
   Scanner aa=new Scanner(System.in);
   num=aa.nextInt();
for(int i=1;i<=10;i++)    {
```

```
    int table=num*i;
    System.out.println(+table);
   }
 }
}
```

Output-



2. Implement a Java program to accept an integer number from user and check whether it is an Armstrong number or not. (Armstrong number: e. g. 153= 13+53+33)

```
import java.util.Scanner;

public class Std11
 {    public static void main(String[]
args)
 {
       Scanner aa = new Scanner(System.in);
System.out.print("Enter an integer number: ");
int number = aa.nextInt();        int originalNumber
= number;        int sum = 0;

       while (number > 0)
       {
          int digit = number % 10;
sum += (digit * digit * digit);
number /= 10;
       }

       if (sum == originalNumber)
```

```
        {
            System.out.println(originalNumber + " is an Armstrong number.");
        }
    else    {
            System.out.println(originalNumber + " is not an Armstrong number.");
        }
    }
}
```

Output-

```
D:\class work>javac Std11.java

D:\class work>java Std11.java
Enter an integer number: 111
111 is not an Armstrong number.
```

3.Program to print numbers less that 5.

Input-

```
public class Main {
    public static void main(String[] args) {
        int count = 0;
        do {
            System.out.println(count);
            Count++;
        }
        while (count < 5);
    }
}
```

Output-

```
C:\Users\Vaishnavi\Desktop\v\classwork>javac Main.java

C:\Users\Vaishnavi\Desktop\v\classwork>java Main
0
1
2
3
4

C:\Users\Vaishnavi\Desktop\v\classwork>
```
